

INTEGRATIONS

Back-end integrations, identity & required data

Which regulatory back-ends are integrable across the Netherlands, Belgium and Germany, what acting-on-behalf actually requires, and the personal data each path needs.

Prepared June 2026 · engineering & product research, not legal advice

What a VAT-compliance platform like BEACON can actually integrate to file on behalf of e-commerce SMEs, what regulatory back-ends each country exposes, and what personal information each path legally requires. Researched June 2026 from official sources (Belastingdienst, Logius, ELSTER, BZSt, FPS Finance, ZSVR, EU Commission) plus vendor docs. Time-sensitive and single-source items are flagged; this is engineering/product research, **not legal advice**.

0. The three things that shape everything

1 ***"Filing on your behalf" is gated by permissions and professional rules, not APIs.** The technical channel usually exists; the right to use it for a client is the hard part.

- **NL:** you need **eHerkenning EH3 + a chain mandate (ketenmachtiging)** to

act for a client.

- **DE:** preparing a VAT return for a third party is **reserved tax advice

under the Steuerberatungsgesetz (StBerG) — **a non-Steuerberater SaaS may not**** sell "we prepare and file your VAT returns." You can be the *technical* transmitter; you cannot be the *adviser* without a Steuerberater in the loop.

- **BE:** filing for a client runs through the **CSAM mandate model

(Mandatenbeheer)**.

1 **Identity numbers are legally restricted — design to avoid them.** The Dutch

BSN in particular may only be processed with an explicit statutory basis; a private filer almost certainly has none. Architect around company-level keys (KvK/RSIN, btw-id, enterprise number, Steuernummer) and minimise buyer PII.

1 **The real integration is commercial, not governmental.** The data that drives

VAT logic — sales by destination, and *where stock physically sits* (the trigger for local registration) — comes from **Amazon SP-API, Shopify, Stripe** etc., not from tax portals. Government back-ends are mostly *output* (filing); marketplaces are the *input*.

1. Cross-cutting / EU layer

System	Purpose	Integration	Access / auth	Notes
VIIES (DG TAXUD)	Validate EU VAT numbers of B2B counterparties	SOAP (checkVat, checkVatApprox) + a public REST endpoint	None — public, no key, no SLA	Pass your own VAT no. to the <i>approx/qualified</i> call to get a consultation number = cross-border evidence of verification. Best-effort, Commission-disclaimed; weaker than DE's BZSt qualified confirmation. Store consultation number + UTC timestamp + raw response.
EU OSS / IOSS	One VAT return for distance sales	No EU filing API — always national portals	Per-MS national eID	SaaS can <i>prepare/validate</i> the return; <i>submission is national</i> .

System	Purpose	Integration	Access / auth	Notes
eIDAS / EUDI Wallet	Cross-border login / KYC of SME users	eIDAS notified eID today; EU Digital Identity Wallet mandated across 27 MS	Relying-party onboarding per scheme	Future single route to authenticate users across NL/BE/DE. Go-live dates phased/slipping — treat 2026–27 as targets.
Company registries / EU BRIS	KYB / company master data	BRIS = e-Justice web UI only, no public API	Web search	For automation use national APIs (KvK is best) or commercial KYB.
Identity proofing (Onfido/Entrust, Veriff, itsme, iDIN)	Passport/liveness onboarding	Vendor REST/SDK	Vendor contract	iDIN (NL) being retired — itsme acquired it, full phase-out ~end-2027. Build NL identity onboarding around itsme / EUDI , not iDIN.
PSD2 / open banking (optional)	Reconcile VAT paid vs declared	Bank APIs via aggregator (Tink/Yapily/Enable Banking)	AISP licence + eIDAS QWAC, or a licensed aggregator; PSU consent	Nice-to-have reconciliation layer, not core.

2. The real VAT input: commercial data sources

Amazon SP-API — detecting the stock-location trigger

Holding stock in a country generally forces a **local VAT registration** there and takes those sales out of OSS. Detecting *where stock physically sits* is the single most valuable integration, and Amazon exposes it:

- `GET_LEDGER_SUMMARY_VIEW_DATA` (and `..._DETAIL_...`) with

`reportOptions.aggregateByLocation = "COUNTRY"` -> tells you which EU country your inventory is in -> drives the local-registration trigger.

- `GET_AFN_INVENTORY_DATA_BY_COUNTRY` — quantity available for fulfilment

by country, near-real-time (ideal for Pan-EU FBA).

- `GET_VAT_TRANSACTION_DATA / SC_VAT_TAX_REPORT (VCS)` — transaction-level

VAT incl. cross-border inbound and FC transfers; covers NL, BE, DE.

Access path: register as an SP-API public developer -> **Login with Amazon

(LWA) OAuth. **Inventory/order roles are non-PII**; the Tax Invoicing / Tax Remittance roles are *restricted* (PII) and require an architecture review plus a Restricted Data Token (RDT)** for any buyer personal data.

Other channels

- **Shopify Admin API** — REST + GraphQL, OAuth scoped tokens; orders carry

`tax_lines` and a `fulfillment_origin_location` (tax sourcing).

- **WooCommerce** — REST, consumer key/secret over HTTPS.
- **eBay Sell API** — OAuth 2.0 scoped tokens.
- **Stripe** — secret/restricted keys; OAuth (Connect); Stripe Tax line data.

PII / GDPR when pulling order data

Order feeds contain buyer name, address, email. You are a controller; you only need address -> jurisdiction + VAT rate, so **minimise**: pseudonymise/aggregate to country + amount where possible. Amazon enforces this

technically (restricted roles + RDT + mandatory data-protection review); mirror those controls for every channel and for VIES consultation logs.

3. Netherlands

Back-end	Purpose	Integration	Access requirements	Data needed
Digipoort (Logius) + SBR/XBRL	M2M filing of btw return + ICP/EC sales list to Belastingdienst	SOAP (WUS 2.0 request/response; ebMS notifications; SFTP for large files). Payload = XBRL vs the Nederlandse Taxonomie. Not REST .	PKloverheid services certificate ; Digikoppeling + OIN registration; preproduction + ValidatieTestService sandbox	XBRL return data; omzetbelastingnummer; signing cert
OSS / IOSS	Quarterly cross-border B2C VAT	! Portal only — Mijn Belastingdienst Zakelijk -> "EU-btw éénloketsysteem". No documented SBR/Digipoort channel	eHerkenning (or EU eID)	Per-country net sales + rates
DigiD	Citizen auth	Gov-only broker	! Not usable by a business SaaS — natural persons only	Citizen BSN-linked login
eHerkenning	Business login to Belastingdienst	SAML SSO (auth, not a filing API)	EH3 ; to act for clients, ketenmachtiging (chain mandate) . Foreign providers without a KvK number can get "EH3 without KvK number"	Client consent form; provider middel
KvK API	Company/KYB lookup	REST/JSON, GET-only (Zoeken, Basisprofiel, Vestigingsprofiel, Naamgeving)	API key (paid); test env + public test key	KvK no. / RSIN as keys

Identifiers & the BSN constraint. Two VAT numbers exist: the public **btw-id**

(on invoices; since 2020 deliberately *not* derived from BSN for sole traders) and the internal **omzetbelastingnummer** (RSIN-based for entities; may still embed a BSN for sole traders). **BSN may be processed only where a law explicitly allows it** (UAVG art. 46 / Wabb) — the regulator (AP) even banned the *Belastingdienst* from putting BSN in VAT numbers, forcing the 2020 change. **A private SaaS should key on btw-id / omzetbelastingnummer / RSIN / KvK and avoid BSN.** Passport/ID (KYC) needs its own basis (e.g. Wwft if you're an obliged entity — a generic VAT filer usually isn't); flag for NL counsel.

Automatable vs manual. **Yes** Periodic btw + ICP via SBR/Digipoort; **Yes** company lookup via KvK; **Yes** on-behalf access via eHerkenning + ketenmachtiging. **No OSS submission is portal-bound** today — you can automate prep/calculation, not the final submit. (Verify with Belastingdienst/Logius before committing.)

4. Germany

Back-end	Purpose	Integration	Access requirements	Data needed
ELSTER + ERiC	Submit UStVA , annual USt, ZM, Fragebogen	Embed the ERiC native C library. No public REST/SOAP API.	Register on ELSTER Entwickler-Bereich; Hersteller-ID per product; ERiC is free; test modes behind dev login	Tax XML + ELSTER certificate

Back-end	Purpose	Integration	Access requirements	Data needed
ELSTER certificate	Authenticate transmissions	. pfx Organisationszertifikat embedded in ERiC	Requires a German Steuernummer (no German location needed); 3-yr validity; one cert files for many clients	Org identity
Vollmachtsdatenbank (VDB)	E-power-of-attorney + pre-filled data	App by Bundessteuerbera terkammer	! Steuerberater only — not open to a general SaaS	Mandate data
BZSt — USt-IdNr	Issue DE VAT-ID	Via ELSTER Fragebogen -> BZSt	Through registration; up to ~2 months	—
BZSt — VAT-ID confirmation (VIES front)	Simple + qualified confirmation of foreign EU VAT-IDs	New REST API since 01.07.2025 (bulk). Old XML-RPC shut down 30.11.2025	Own DE USt-IdNr; BOP certificate (existing ELSTER cert reusable)	Own + target USt-IdNr (+ name/address for qualified)
Verpackungsregister / LUCID	Packaging EPR registration + Mengenmeldung	Manual XML upload via portal . Register- <i>excerpt</i> check has an API; reporting has no M2M API and third-party submission is prohibited	LUCID login; registration is personal (foreign-rep exception does not cover registration)	Brand names, packaging volumes
Handelsregister / Unternehmensregister	Company/KYB	Free since DiRUG (2022) but no official developer API	—	Company no./name

The StBerG constraint (the binding limitation). Preparing VAT returns for third parties is reserved "tax advice" under §§ 2–3 StBerG; only Steuerberater, lawyers, Wirtschaftsprüfer etc. may do it. Even trained bookkeepers may **not** prepare the Umsatzsteuervoranmeldung (BFH, II R 22/15). A non-Steuerberater SaaS can build the tooling and act as the **technical transmitter** (taxpayer owns the authorisation / signs), or offer self-service prep — but cannot sell "we prepare and file for you" without a Steuerberater in the loop.

Identifiers. Personal **Steuer-ID (IdNr)** (11-digit, lifelong) vs **Steuernummer** (per Finanzamt; needed for the ELSTER cert) vs **USt-IdNr** (BZSt, EU trade) vs the new universal **W-IdNr** (rollout ongoing). NL sellers register via the ELSTER **Fragebogen zur steuerlichen Erfassung** (foreign-law-corporation form), providing their Dutch BTW-nummer; NRW Finanzämter (Kleve) handle NL cases. Foreign sellers can get a **Mein Unternehmenskonto / ELSTER cert** with a German Steuernummer but no German location; **BundID** supports EU eID login.

Automatable vs manual. **Yes** ERiC filing (only via the native lib, no REST); **Yes** BZSt REST VAT-ID validation; **!** on-behalf preparation is **legally** constrained; **No** LUCID registration/reporting is manual and non-delegable; **Partly** no official Handelsregister API.

5. Belgium

Back-end	Purpose	Integration	Access requirements	Data needed
Intervat (FPS Finance)	Periodic VAT return, IC statement, annual client listing, OSS	(1) Browser XML upload vs published XSDs; (2) NEW Intervat-API since ~Feb 2025 for periodic returns from software	"Recognized user of FPS Finance APIs" registration via MyMinfin; user agreement; validation tests. Specs released only after registration	VAT/enterprise no.; XSD-conformant data; IC client VAT nos. validated vs VIES
MyMinfin-API	Retrieve filing receipts/confirmations	REST-style, live ~Feb 2025	Same "recognized user" model; required companion to Intervat-API	Enterprise no., doc refs
CSAM + FAS (BOSA)	Identity / auth front-door	Interactive login only (eID, itsme , eIDAS, TOTP). No M2M auth ; certificate auth discontinued 03/2024	A human with a recognised key acting for the company	Human identity credential
Mandates (Mandatenbeheer)	File VAT on behalf of a client	Web app; mandate validity carries into the API	Both parties authenticate via CSAM; client approves	Enterprise nos. of both parties
KBO/BCE	Company/KYB	Free Public Search UI; Public Search web service (paid); Open Data bulk CSV + SFTP	Register for web service/open data	Enterprise no. (10 digits, leading 0)
IVCIE + Fost Plus / Valipac	Packaging EPR	Portal only — no public API found	IVCIE registration; foreign sellers appoint a representative	Packaging quantities/materials
FORREG	Foreign-company VAT registration	Web app; login via CSAM or eIDAS	Foreign company; document upload; manual validation -> enterprise no.	Company legal data, foreign tax ID, ID docs

Identifiers. Company key = **enterprise number (KBO/BCE)**; VAT no. = BE + enterprise number.

Rijksregisternummer is for natural persons only (the human who authenticates). ****An NL (EU) company does not need a fiscal representative**** in Belgium — only non-EU companies do.

Automatable vs manual. The picture **changed in early 2025**: **Yes** periodic VAT

return filing + receipt retrieval are now automatable via the new Intervat/MyMinfin APIs; **Yes** KBO open data. Still manual: **No** IC statement & annual client listing (XSD upload, human submit); **No** CSAM auth (interactive only); **No** FORREG registration & mandate setup; **No** Fost Plus/IVCIE EPR (no API — the biggest gap vs DE's LUCID excerpt API). Protocol details (REST/OAuth, certs, sandbox) are **unpublished until you register** — flag as unverified.

6. What personal information you actually need

Keep it to **company-level identifiers** wherever possible; collect person-level data only for the human who authenticates or signs, and ID documents only with a clear legal basis.

	Netherlands	Germany	Belgium
Company identifier	KvK number, RSIN, btw-id, omzetbelastingnummer	Steuernummer, USt-IdNr, (W-IdNr)	Enterprise number (KBO/BCE), BE VAT no.
Person identifier	BSN — avoid; legally restricted	Steuer-ID (IdNr) — only where required	Rijksregisternummer — for the authenticating person only
Auth credential	eHerkenning EH3 (+ ketenmachtiging)	ELSTER Organisationszertifikat	CSAM via eID / itsme / eIDAS

	Netherlands	Germany	Belgium
Passport / ID (KYC)	Only if Wwft-obliged or for registration; basis required	For Fragebogen / legal reps; verify form version	For FORREG registration & foreign signatories without eID
Beneficial owner	UBO register (separate)	Transparenzregister (separate, not the Fragebogen)	UBO register (separate)

Rule of thumb: identifiers like NL **BSN** and buyer PII from order feeds are

the highest-risk data. Avoid BSN entirely if you can; pull only the order fields needed to determine place of supply; hold ID documents only behind a named legal basis and DPA-bound processors.

7. Consolidated build verdict

Capability	NL	DE	BE
File periodic VAT return (M2M)	Yes SBR/Digipoort (SOAP+XBRL, PKIoverheid)	Yes ERiC native lib (no REST)	Yes Intervat-API (since 2025)
File EC sales list / IC listing	Yes via SBR	Yes ZM via ERiC	No XSD upload, manual submit
File OSS	No portal only	No portal (BZSt)	No portal
VAT-ID validation	VIES (EU)	Yes BZSt REST (2025)	VIES (EU)
Act on behalf — mechanism	eHerkenning + ketenmachtiging	ELSTER cert (technical)	CSAM mandate
Act on behalf — legal limit	mandate required	! StBerG: Steuerberater only to prepare	mandate required
Company/KYB API	Yes KvK REST	No no official API	Partly KBO open data
Packaging EPR API	n/a	Partly excerpt check only; reporting manual & non-delegable	No none
Auth = machine-to-machine?	cert-based (PKIoverheid)	cert-based (ELSTER)	No interactive CSAM; APIs use "recognized user" reg

8. What this means for BEACON's architecture

1 Be the system of record + technical transmitter, not the unlicensed adviser.

In DE especially, run filing as **self-service prep + ERiC transmission**, and **partner with a Steuerberater** for anything that crosses into preparation/ advice. In NL/BE, obtain the **eHerkenning chain mandate / CSAM mandate**.

1 Make Amazon SP-API (stock-by-country) a first-class integration — it's what

detects the OSS-breaks-here moment and turns the configurator's logic into live monitoring. Add Shopify/Stripe for non-Amazon sellers.

1 Three filing back-ends, three certificate/identity models: PKIoverheid

(NL), ELSTER cert (DE), CSAM "recognized user" (BE). Budget for ERiC being a native library you must embed and ship, not a REST call.

1 Treat OSS + EPR as prep-and-guide, not auto-file — OSS submission is portal-

bound in all three; EPR (LUCID/Fost Plus) is manual and, in DE, legally non-delegable. Productise these as guided workflows + document generation.

1 Privacy by design: key on company identifiers, **avoid BSN**, minimise buyer

PII, mirror Amazon's restricted-data controls everywhere, DPA every processor.

9. Open items to verify before building

- NL **OSS** via **Digipoort** — no channel found; confirm with Belastingdienst/Logius.
- NL **BSN lawful basis** and **Wwft** status — NL counsel.
- DE **StBerG** boundary for fully-automated filing-as-a-service — DE tax counsel.
- DE **ERiC** sandbox specifics, **W-IdNr** rollout status (behind dev login).
- BE **Intervat/MyMinfin API** protocol, certs, sandbox (unpublished pre-registration);

KBO web-service pricing (third-party reported).

- Time-sensitive: **EUDI Wallet** dates, **itsme/iDIN** migration, all API rate

limits/pricing — re-verify at build time.
